Cybersecurity Awareness Calendar 2024

September
IOT

Turning up Neon Lights for Awareness Nights!

EUROPEAN CYBER SECURITY ORGANISATION

ECSCO aims to spread awareness of key aspects of cybersecurity and showcase ECSCO Members and the cybersecurity community's solutions and services.

Introducing our 2024 topics:

January: Zero trust

February: Quantum Computing and cryptography

March: Ransomware

April: Cybersecurity solutions to secure SME businesses

May: The road to a career in cyber

June: Supply Chain

July: European regulations and compliance

August: 5G Security

September: IOT

October: Artificial Intelligence

November: Threat vulnerability

December: Cloud computing

Simplifying IoT: Innovative eSIM specification takes center stage

GSMA's release of an eSIM specification for constrained IoT devices revolutionizes remote SIM provisioning. Addressing challenges in managing smaller sensors, this innovation simplifies the process. Device owners order profiles from a mobile service provider, enabling the eSIM IoT Remote Manager to facilitate secure, encrypted profile downloads to the eUICC. Anticipated to streamline eSIM adoption for IoT, this advancement promises easier connectivity management that integrates well with different device management solutions.

Ensuring IoT Security

The Internet of Things (IoT) represents a network of connected devices that collect and exchange data in real-time, enhancing efficiency across many sectors. However, IoT security is a crucial challenge, as these devices are often vulnerable to cyberattacks, privacy threats, and remote manipulation. Exprivia has become a member of the ioXt Alliance (Internet of Secure Things), the global network for IoT device security, involving key players in the technology sector with the aim of creating internationally recognized security standards. IoT devices are constantly increasing, and for user safety, they must be certified according to globally recognized security standards. The Exprivia CyberSecurity team will be able to verify the adoption of reliable cryptographic protocols with authentication mechanisms that do not allow universal passwords, verify software vulnerabilities and their updating process, to protect security in a guaranteed minimum period of time.

Learn about IoT security with ISC2

The ISC2 logo is displayed in a large, white, sans-serif font. It is positioned in the upper right quadrant of the slide. The background of the slide is dark blue with abstract, glowing purple and blue fiber-optic-like patterns that swirl and overlap, creating a sense of digital connectivity and complexity.

IoT devices are particularly vulnerable to threats. ISC2 has a host of resources to help information security professionals to understand and address those vulnerabilities.

Courses

ISC2 provides courses to help information security professionals stay up to date on how to secure IoT:

Resources from the Community

The Interconnected Future: IoT Devices and Cybersecurity

With over 75 billion IoT devices expected worldwide by 2025, these technologies are integrating into every aspect of modern life - from smart homes and connected life cars to industrial automation and healthcare monitoring. However, this interconnected future also introduces significant cybersecurity challenges, including supply chain vulnerabilities, privacy issues, inadequate security measures, and more. Read the article to discover how to mitigate these risks.

THE DOSS IoT SUPPLY TRUST CHAIN CONCEPT (STC)

The Horizon Europe DOSS project enhances IoT security by introducing an integrated monitoring and validation framework across the entire supply chain. Using a modular architecture, it verifies devices and software, tracking their security throughout their lifecycle. Central to this is the Device Security Passport (DSP), stored on a decentralized platform and validated by a Digital Cybersecurity Twin. The framework ensures only authentic products are installed, security is continuously monitored, and compliance with legal standards is maintained.
