OSCAL's Role in European Cybersecurity Public Policy

Cristian Tracci

Senior Manager, Policy Analysis and Outreach Stream, ECSO

What role does automated compliance play in today's European cybersecurity policy landscape?

How can OSCAL help?

EU Policymakers Have Been Very Active

In Brief

Multiple pieces of legislation touching upon cybersecurity were proposed in the last few years and some already entered into force and are being implemented.

Policies intersections and overlaps are growing, making compliance more challenging.

NIS2 Directive

Cyber Resilience Act

Cyber Solidarity Act

Cybersecurity Act

AI Act

Radio Equipment Directive

EU Space Law

Europe's Digital Infrastructure

5G Toolbox

DORA

EU Digital Identity

Digital Networks Act

Illustrative list

[illegible]

154 policies documents mentioning cybersecurity

The collage displays a variety of data management tools and documents:

- Spreadsheets:** Multiple tables with columns for dates, names, and numerical data, some with highlighted rows and columns.
- Forms and Templates:** Documents with structured fields for data entry, including sections for "Personnel" and "Equipment".
- Tables of Contents:** Lists of sections and their corresponding page numbers, such as "Introduction", "Methodology", and "Results".
- Flowcharts and Diagrams:** Visual representations of processes or organizational structures.
- Reports and Documents:** Various types of text-based documents, including what appears to be a project charter or a research report.

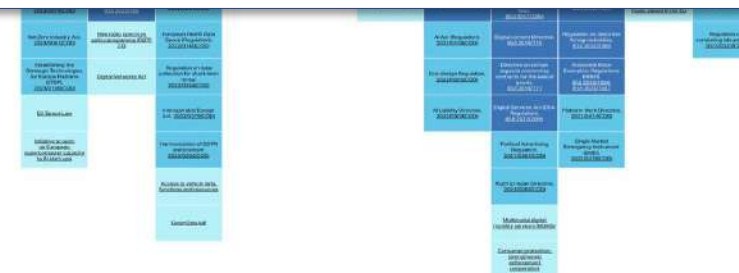

The overall theme is the integration and management of diverse data sources and information formats.

From Cybersecurity Policies to Audits in Brief

What does it look like concretely?

Cybersecurity policies and laws set high-level security domains or requirements

NIS2 Directive

DIRECTIVE (EU) 2022/2555 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL
of 14 December 2022

on measures for a high common level of cybersecurity across the Union, amending Regulation (EU) No 910/2014 and Directive (EU) 2018/1972, and repealing Directive (EU) 2016/1148 (NIS 2 Directive)

[...]

Article 21

Cybersecurity risk-management measures

The measures referred to in paragraph 1 shall be based on an all-hazards approach that aims to protect network and information systems and the physical environment of those systems from incidents, and shall include at least the following:

- (a) policies on risk analysis and information system security;
- (b) incident handling;
- (c) business continuity, such as backup management and disaster recovery, and crisis management;
- (d) supply chain security, including security-related aspects concerning the relationships between each entity and its direct suppliers or service providers;
- (e) security in network and information systems acquisition, development and maintenance, including vulnerability handling and disclosure;
- (f) policies and procedures to assess the effectiveness of cybersecurity risk-management measures;
- (g) basic cyber hygiene practices and cybersecurity training;
- (h) policies and procedures regarding the use of cryptography and, where appropriate, encryption;
- (i) human resources security, access control policies and asset management;
- (j) the use of multi-factor authentication or continuous authentication solutions, secured voice, video and text communications and secured emergency communication systems within the entity, where appropriate.

Cyber Resilience Act (CRA)

EN

OJ L, 20.11.2024

ANNEX I

ESSENTIAL CYBERSECURITY REQUIREMENTS

Part I Cybersecurity requirements relating to the properties of products with digital elements

- (1) Products with digital elements shall be designed, developed and produced in such a way that they ensure an appropriate level of cybersecurity based on the risks.
- (2) On the basis of the cybersecurity risk assessment referred to in Article 13(2) and where applicable, products with digital elements shall:
 - (a) be made available on the market without known exploitable vulnerabilities;
 - (b) be made available on the market with a secure by default configuration, unless otherwise agreed between manufacturer and business user in relation to a tailor-made product with digital elements, including the possibility to reset the product to its original state;
 - (c) ensure that vulnerabilities can be addressed through security updates, including, where applicable, through automatic security updates that are installed within an appropriate timeframe enabled as a default setting, with a clear and easy-to-use opt-out mechanism, through the notification of available updates to users, and the option to temporarily postpone them;
 - (d) ensure protection from unauthorised access by appropriate control mechanisms, including but not limited to authentication, identity or access management systems, and report on possible unauthorised access;
 - (e) protect the confidentiality of stored, transmitted or otherwise processed data, personal or other, such as by encrypting relevant data at rest or in transit by state of the art mechanisms, and by using other technical means;
 - (f) protect the integrity of stored, transmitted or otherwise processed data, personal or other, commands, programs and configuration against any manipulation or modification not authorised by the user, and report on corruptions;
 - (g) process only data, personal or other, that are adequate, relevant and limited to what is necessary in relation to the intended purpose of the product with digital elements (data minimisation);
 - (h) protect the availability of essential and basic functions, also after an incident, including through resilience and

The security measures are detailed in different security controls frameworks

Security controls frameworks rely on assessments via spreadsheet, or

Or GRC tools, supporting the process

Eventually leading to certified audits or product certifications

Establishing a Complex Ecosystem

So What?

The process remains burdensome: How automated compliance can help

Compliance Challenges In Brief

- Complex procedures
- Resource demands
- Lack of expertise
- Tedious tasks
- Time-consuming processes
- Dependence on external professionals

Europe wants to improve its cybersecurity overall posture

To do so, compliance processes must be improved, to become more efficient and effective.

Automated compliance can assist in achieving this by:

- Providing a standardized approach (common language and processes),
- Facilitating swift assessments, once properly configured,
- Relying on machine-readable formats for sharing and processing audit report,
- Making continuous monitoring a reality, thanks to its automated setup.

Zooming into OSCAL: What's Needed Next?

For discussion

Success Factors	Description	Open Questions
Frameworks	The security controls frameworks, used to comply with the security measures outlined in EU (and global) cybersecurity policies, need to be represented in OSCAL	Who should do the representation? Should it be done centrally by European and national institutions? Or by independent third parties?
Tools	OSCAL-based GRC tools need to be developed and brought to market	Is there an untapped market segment in Europe for OSCAL-based GRC tools?
Testing	Pilot projects need to be developed and run to test tools and processes and ultimately reach effective and efficient adoption	Could pilots be run under Digital Europe Program (DEP) projects?
Adoption	The cybersecurity compliance ecosystem, including both national authorities as well as actors along the supply chain, need to adopt and accept OSCAL reports	How could national authorities' buy-in be achieved?

What other success factors are there?

What other questions are unanswered today?
